

TEST FACTORY

INDUSTRIALIZING
SOFTWARE QUALITY
ASSURANCE

KEY BENEFITS

- **Cost Stability:** Predictable budgets by externalizing the financial risk of idle resources via SLAs.
- **Domain Knowledge:** Securing industry expertise as structural capital, independent of staff turnover.
- **Scalability on Demand:** Frictionless capacity adjustments without the overhead of hiring or firing.
- **Flexible Sourcing:** Demand-driven allocation of interchangeable specialists from a centralized pool.
- **High Product Quality:** Defect reduction through forced process compliance instead of individual excellence.
- **Consulting & Innovation:** Strategic optimization by exploiting aggregated data from the client portfolio.
- **Standardisation & Governance:** Consistent, auditable methods replacing ad-hoc individual practices.
- **IT / Testing Governance:** Centralized oversight ensuring strictly auditable and compliant test execution.
- **Audit-Proof Documentation:** Auditable test documentation due to standardization, especially helpful for highly regulated sectors.

BUILD YOUR OWN TEST FACTORY!

We provide the structural blueprint and the specialized workforce, ensuring you retain absolute governance over your testing processes and vendor ecosystem.

Whether you require strategic consulting to establish centralized control or scalable execution power from our experienced consultants, we supply the targeted expertise to institutionalize your QA.

Let us construct your machinery, so you can focus on directing the output.

WHAT IS A TEST FACTORY?

A Test Factory is a centralized, managed testing model that delivers standardized quality assurance across all projects and releases, governed by the client organisation.

The diagram on the right shows how it works in practice: the company retains full control through a structured steering layer, the service provider manages sourcing and delivery.

The model is designed for organisations of sufficient scale: software buyers, integrators, and developers running multiple projects or releases in parallel. Here, individual experts and isolated test teams reach their limits: Knowledge stays siloed, standards are not shared, and scaling requires hiring cycles.

A Test Factory removes these constraints. Operating even within a multi-provider ecosystem, it sources the right specialists on demand — ramping up when a project phase begins, scaling back immediately when it ends.

Internal domain experts retain directional control and are actively supported, not replaced. The result: flexible, governed, cost-predictable delivery across the entire portfolio, without idle capacity or redundancy risk.

GOVERNANCE & OPS
